

Did you know...

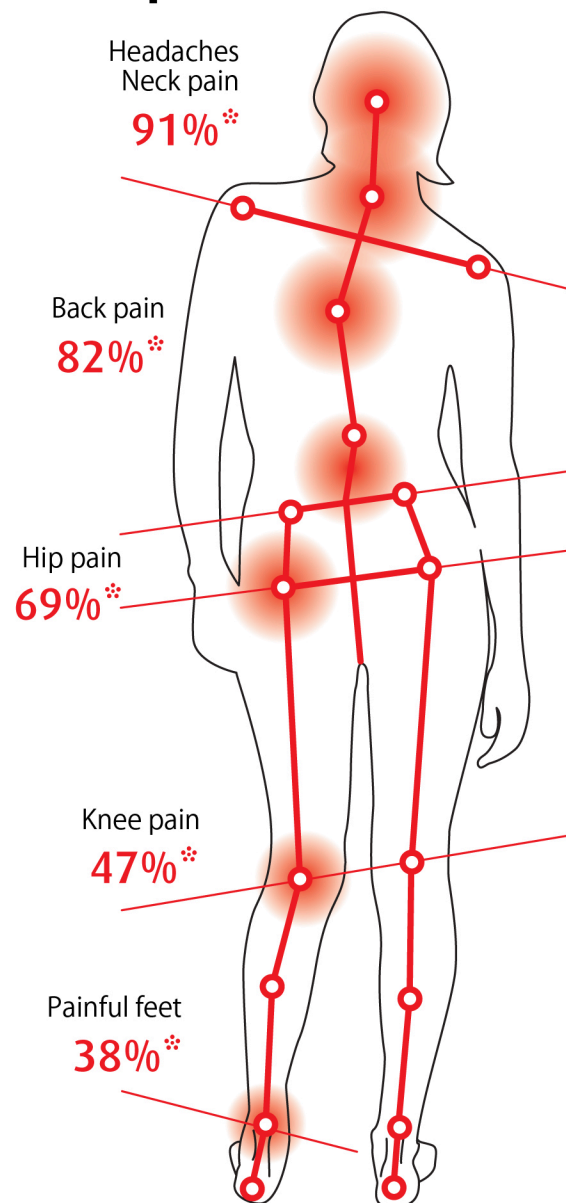

The jaws are solicited on average 10,000 times per day and 80% of the population do so in an unbalanced way.

This unbalance between the two jaws is mainly caused by a disorder of the masticatory muscles and / or a bad occlusion. The fact of clenching your teeth or masticating food the wrong way promotes asymmetrical tensions in the muscles of the head and neck, it will eventually causes disturbances of the posture in descending chain.

To oppose this phenomenon, the KINEPOD laboratory offers the best stabilizing tool for jaws, the active oral orthosis. In just a few minutes, this dynamic orthosis is able to stimulating all the muscular chains of the human body, causing an adapted muscle workout, a perfect motor coordination, a balanced posture and an exceptional proprioceptive workout of the jaws.

An active and effective tool to quickly feel better in your body as well as in your head!

If you are affected by any of these problems...

*Relief by area in percentages (data from Kinepod patients).

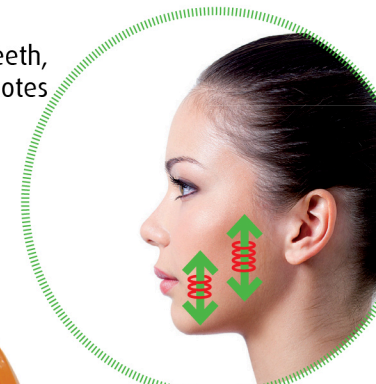

...then relieve your pain by adopting the active oral orthosis today !

Why is it really effective?

Made of an elastic material with shape memory of the highest quality, it forces muscles to recover their primary functions thanks to its active spring system.

It works as a dental guide and by a conscious mastication forces the patient to perform a really active work in self stimulation.

So the OBA allows a perfect proprioceptive solicitation (teeth, ligaments, muscles,...), promotes a balanced muscle work and thus provides the patient an extreme relaxation of the temporomandibular joints.

1st jaw balancer

**Bisphenol
and phtalate
free**

Short-term targets :

- An improvement of masticatory dynamic
- A mandibular repositioning
- A balanced occlusion
- A real efficiency against bruxism and temporomandibular joint disorders.
- Rehabilitation of mastication, nasal breathing, swallowing and phonation.
- A reduction of snoring and a better sleep quality.

To obtain beautiful teeth,
discover the 1st orthodontic
active pacifier

Designed
for Kids

Benefits

- helps stops thumb sucking
- reinforces the mouth muscles
- helps develop nasal breathing
- reduces snoring and allows a better sleep
- relieves pains during teeth growth
- guides the teeth into a correct position
- calming and reassuring effect
- descending chain effect on the posture

Highly efficient for athletes !

Indeed, the active oral orthosis enables the increase of physical capacities while training but also in competition.
(for athletes knowing their limits)

The orthosis allows an instant increase in force and resistance in modifying the posture in ascending chain, balancing pressure and contact points on the teeth and relaxing muscular tensions.

Moreover, wearing the orthosis requires a nasal breathing, which helps increase the breathing capacities of the sportsmen and sportswomen.

Advice

Day : the active oral orthosis may be for maxillo-facial muscular reinforcement exercises while guiding the teeth into a correct position.

Night : to ensure a perfect temporo-mandibular joint relaxation and counter bruxism (teeth grinding)

Teeth grinding ? Snoring ?
Headaches ? Neck or back pains ?
